1. In 1950, an extensive deposit of natural hydraulic cement was found at Hejőcsaba (J 87), near Miskolc. It is estimated, that the annual yield of this field will be 120,000 tons
 - a. Mixed with ordinary cement, this material yields an elastic concrete, which is not affected by either water or by acid. It is therefore particularly useful for underwater and port construction.
 - b. Work was begun, in 1951, on a factory at Eger-Tihamer, near Eger (J 55), for bricks made of hydraulic cement. The factory is to be finished in 1952. To make these bricks, the cement is ground, mixed with lime, and poured into moulds--rather than pressed. The capacity of the factory will be 35 million double bricks, per year.
2. Fuller's earth was found at Nagytetény (H 41), near Budapest. The deposit consists of a thin layer of volcanic origin. A terra-chemical plant was built in 1946 near the site, which produces fuller's earth for a factory in Deggendorf, West Germany.*
3. An underground arms factory is located about 4 km. northeast of Vác (H 65) and about 2 km. from the road, near Szendehely (H 66). Entrance to the factory is gained by a tunnel 3 m. wide. The machines, among which are many lathes with spans of 80-200 cm., are new and of Swedish, Swiss, and German origin.

25X1A* [REDACTED] Comment: Presumably, the Otto Schober, Maschinenbau Werke, at Deggendorf.
